The screenshot shows a ResearchGate profile page for Gal Ziv. At the top, there's a navigation bar with links for HOME, PROJECTS, QUESTIONS, and JOBS. To the right of the navigation are search icons and a blue 'Add new' button. Below the navigation is a profile section for Gal Ziv, featuring a circular photo of him wearing sunglasses, his name 'Gal Ziv', and a 'H2' rating of 20.77. It also lists his title as 'Lecturer' and his affiliation as 'Orde Wingate Institute for Phy...', 'Tel Aviv', and 'Motor Learning'. A 'Message' button and a 'Follow' button ('You follow Gal. Unfollow') are also present. Below the profile section are tabs for Overview, Contributions, Timeline, Info, Stats, and Scores. The Overview tab is selected, showing statistics: 31 Publications, 4.88k Reads, 382 Citations, and 11 Full-texts. There's a 'View stats' button next to these numbers. Below this, there's a 'Featured publications' section with three items. The first item is an article titled 'Article: Is a 'quiet eye' all it takes to be successful? Comment on Vickers' by Werner F. Heisen, Doron Levin, Gal Ziv, and Marco Davare. The second item is an article titled 'Article: Achieving Expertise in Sport: Deliberate Practice, Adaptation, and Periodization of Training' by Ronnie Lidor, Gershon Tenenbaum, Gal Ziv, and Vladimir Israelev. The third item is an article titled 'Article: Physical and Physiological Attributes of Soccer Goalkeepers – Should We Rely Only on Means and Standard Deviations' by Pantelis Theo Nikolaidis, Gal Ziv, Michal Arnon, and Ronnie Lidor. To the right of the publications section are sections for 'Skills and expertise' (including Motor Learning and Motor Control, Motor Learning, Athletic Performance, and Sports Science), 'Top co-authors' (listing Pantelis Theo Nikolaidis, Yossi Meckel, Gershon Tenenbaum, Marco Davare, and Werner F. Heisen), and a '24 Following' section which is currently empty. The bottom right corner of the screenshot contains the text 'Quelle: ResearchGate'.

Is it possible to research and evaluate an athlete's decision making skill?

For my dissertation I am lucky enough to research 3D MOT(multiple object tracking) software to identify progression in MOT. 3D MOT has a great clinical background with improving peripheral awareness, pedestrian avoidance for elders, recover from injury and it also boasts the ability to improve decision making. As the software I will be using is up and coming in the professional sporting environment I would like to test the relationship of MOT and decision making skills however the question arises as to is it possible to test decision making skills in a sport environment? And if so how? Is it academically backed?

there are probably other tests available in the Psychology field, but as a start you might check out the "Go-No Go" test. I used it in my poster (available on ResearchGate): "Signs of mild traumatic brain injury in active duty us marines can be measured with brain MRI magneto-encephalography."

1. Tayebi, S. M., Mahdian, H. & Mahmoudi, S. A. (2016). Short-term adaptation of some iron indices of young elite wrestlers to three types of aerobic, anaerobic, and wrestling training (Kurzfristige Anpassung einiger Eisen-Indizes junger Spitzensklasseringer an drei Arten aeroben, anaeroben und ringerspezifischen Trainings). *International Journal of Applied Exercise Physiology*, 5 (1), 12-16. The central role of iron in oxygen transport makes it a key element for sports performance. Since acid-based balance is among the most important functions conducted by iron and the dominant energy system in wrestling depends on acid lactic system, then the investigation of wrestlers' iron status would be an important issue. The present study was conducted to study the short term adaptation to some iron indices of elite wrestlers to two and three non-consecutive sessions of three types of aerobic, anaerobic, and wrestling exercises. A total of 24 elite volunteer wrestlers with the history of at least 5 years sport activity and three wrestling sessions per week were randomly categorized into three groups of eight people practicing aerobic, anaerobic, and routine wrestling exercises. The exercises were conducted during three non-consecutive sessions within a week. The aerobic exercises included 35 min of continuous running with 130 beats per minute (BPM) on a treadmill machine, the anaerobic exercises included 15 min circuit movements and 15 min rest with 160 BPM, and the wrestling training included routine wrestling exercises. Blood sampling was done 24 h before the first session, 24 h after the second session, and 24 h after the third session in order to investigate the short term adaptations. The study of short term adaptation to two non-consecutive exercise sessions showed that aerobic exercise as compared to wrestling exercise led to significant decline in serum iron ($p=0.006$). Wrestling exercise as compared to aerobic and anaerobic exercise led to significant decline of serum ferritin [respectively ($p=0.014$) and ($p=0.004$)]. Serum TIBC of three aerobic, anaerobic, and wrestling exercises groups had no significant difference ($F=1.24$, $p=0.309$). The study of short term adaptation to three sessions of non-consecutive exercises showed that none of the variables of serum iron, ferritin, and TIBC in the three aerobic, anaerobic, and wrestling exercises groups had no significant change [respectively ($F=2.4$, $p=0.11$), ($F=3.04$, $p=0.07$), and ($F=1.33$, $p=0.29$)]. In the study of short term adaptation to two non-consecutive stages, the wrestlers who practiced wrestling exercises confronted the first stage of iron deficiency in short term adaptation to two non-consecutive stages, because they showed lower level of iron stores (reduced level of serum ferritin). On the other hand, the wrestlers who practiced aerobic exercises had lower level of serum iron and so were settled in the second stage of iron deficiency. However, there was no difference observed between the practical methods in terms of iron indices in the study on short term adaptation to the three stages of non-consecutive stages.
